

Boundary-posterior drift (Tavgigian) vs combination error (Piecewise)
 Tavgigian: exact at $p=0.10$ · Piecewise: exact boundaries, small combo error

Single-assay boundary error
 Piecewise: always 0 · Tavgigian: drifts from calibrated $p=0.10$

Two-assay combination error vs prior
 Piecewise self-consistency (solid) · Tavgigian vs PW reference (faint)

Net winner per combination (+ = piecewise better)
 Both measured vs same piecewise per-code LR+ reference

Absolute combination error at two priors
 Tavgigian (solid) vs Piecewise self-consistency (hatched)
 Both vs piecewise per-code LR+ product as reference
